

Abyssinica SIL Features

The Ethiopic script does not require much rendering except for some combining marks for gemination and vowel length. Abyssinica SIL provides both OpenType and Graphite rendering solutions for rendering the combining marks and for kerning as well as for the special glyph variations that can occur for the Ethiopic script. The tables below give lists of the OpenType Stylistic Sets and OpenType Character Variants available in Abyssinica SIL.

Abyssinica SIL OpenType Features

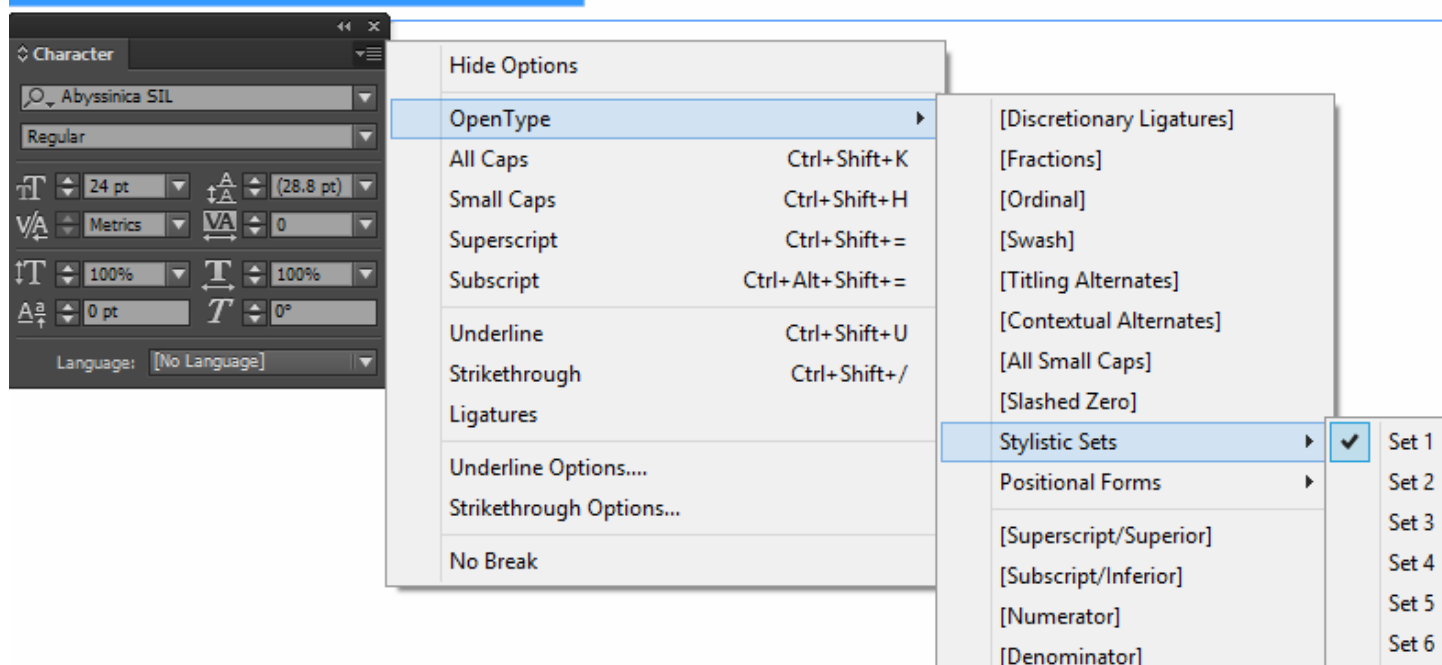

New (version 1.500): Character Variants were added to Abyssinica SIL. If an application supports Character Variants, those are preferred. The Stylistic Sets do not offer as many options as are available in the Character Variants. However, the OpenType Stylistic Sets are still in the font in order to provide support for applications (such as InDesign CS4+ and Microsoft Office 2007+) that only support Stylistic Sets and not Character Variants.

Stylistic Sets

In InDesign, from the “Character” palette select “**OpenType / Stylistic Sets**” and then choose the Set you want to apply to the text you have selected. The default character should change to the variant character. You can also set your Stylistic Set preference in paragraph and character styles. It is recommended to have “[No language]” selected if there is no Ethiopic-based language available.

ሀ ለ ለ ለ ለ ለ ለ

ሀ ለ ለ ለ ለ ለ ለ

In Microsoft Word, select the text, then select “Font / Advanced” and then choose the Stylistic Set you want to apply to the text you have selected.

Stylistic Sets Table

OpenType Feature Name	Feature setting	Feature IDs	Character shapes
Archaic Oromo dda forms (U+12F8..U+12FE)	Standard		፩ ፪ ፫ ፬ ፭ ፮
	Alternate	ss01	፩ ፪ ፫ ፬ ፭ ፮ ፯ ¹

	Disconnected	ss12	ኘ ⁷
xoa alternate (U+1287)	Standard		ኘ
	Alternate	ss13	ኘ
Latin punctuation	Ethiopic-style		! \$ % * + / 0 1 2 3 4 5 6 7 8 9 = ? ; © « ² ³ ¹ » × ‘ ’ “ ” ‹ › ⁰ ⁴ ⁵ ⁶ ⁷ ⁸ ⁹ €
	Latin-style	ss14	! \$ % * + / 0 1 2 3 4 5 6 7 8 9 = ? ; © « ² ³ ¹ » × ‘ ’ “ ” ‹ › ⁰ ⁴ ⁵ ⁶ ⁷ ⁸ ⁹ €

Character Variants

For applications which support OpenType Character Variants, such as in CSS, the Character Variant ID and setting is chosen. For example, in CSS, if cv32, is desired, you might have this code in your .css:

```
...
@font-face {
  font-family: AbyssinicaSIL;
  src: url(AbyssinicaSIL-R.woff);
}
.cv320 {
  font-family: AbyssinicaSIL;
  -moz-font-feature-settings: "cv32" 0; font-size: 200%;
}
.cv321 {
  font-family: AbyssinicaSIL;
  -moz-font-feature-settings: "cv32" 1; font-size: 200%;
}
...
```

and this in your .html:

```
<p class=cv320> ደ ዳ ዲ ዳ ዴ ድ ዶ</cv320> [cv32=0]</p>
<p class=cv321> ደ ዳ ዲ ዳ ዴ ድ ዶ</cv321> [cv32=1]</p>
```

Which would produce this:

ደ ዳ ዲ ዳ ዴ ድ ዶ [cv32=0]

ደ ዳ ዲ ዳ ዴ ድ ዶ [cv32=1]
